It's a must-have for career advancement, and for most employers, a pre-requisite for employment. The institute grants two different CHISP credentials: one for Clinical and a second for Health System Administration. Here's the breakdown of which you should prepare for. The CHISP-Clinical Image Source: CertifiedHealthInformatics.org The CHISP-Clinical credential is applicable to individuals or teams of up to two individuals who work in healthcare informatics (or related fields). It is intended for professionals who work in healthcare organizations to help improve patient care through the use of technologies. This includes clinical information systems and other aspects of health IT, such as patient-centered medical homes, patient safety, electronic medical records, mobile devices, biomedical devices, and research. It is a comprehensive and progressive certification program that covers all aspects of healthcare IT. This credential comes from a recognized provider: The Institute for Healthcare Informatics (IHI), a nonprofit organization that brings together experts in informatics, healthcare, and medicine. For health informatics professionals interested in careers in clinical IT, this certification is a good one. It is appropriate for individuals who work in hospitals and other clinical settings, such as medical centers and medical offices. So, anyone who works with patient care or data is a good fit. Other related fields that can benefit from the CHISP-Clinical credential include hospital/health systems administration, health IT consulting, and health IT vendor management. The CHISP-Health System Administration The CHISP-Health System Administration credential is for professionals working within health IT organizations and seeking career advancement. The aim is to have a team certification for information technology management within a healthcare organization. Healthcare IT professionals work with data management and software systems that manage the care of patients. The CHISP-Health System Administration is one of the highest-ranking IT certifications in the healthcare arena. It is the only credential awarded by the institute to certify IT professionals in healthcare IT. It has a comprehensive exam that covers four domains: health IT product management, health IT finance, health IT technology, and health IT operations. As a result, this certification is for anyone who manages IT within a healthcare organization. It does not have the same scope as the CHISP-Clinical credential, so it is focused on those in operational roles. This certification is a high-demand 82157476af
